Stakeholder Value

Item 1:

- User Story 1 (**High Priority**): As a Faculty Advisor, I want to view real-time seating capacity and be able to give immediate enrollment overrides for closed courses to resolve critical scheduling conflicts for Seniors during walk-in advising sessions.
- Acceptance Criteria:
 - *The advisor's dashboard should display real-time count of available seats, for example, "35/40 seats fill" is shown, for all the active courses.
 - *The screen should provide an "Authorize Override" button right next to the section. When clicked allows the student to bypass capacity limits and forces enrollment in the section.
- Value Justification:

This specific feature will address a pain-point for the faculty advisor group during peak registration period. It's important as Advisors face large amounts of students who need immediate graduation track enrollments. Allowing advisors to bypass authority, it prevents the need to receive confirmation and a waiting period for a student in need. This can lessen the burden during a peak enrollment period.

Item 2:

- User Story 2 (**Medium Priority**): As a student, I want to be able to pick and add 5 sections in a pre-planned course planner so that when courses are open I can submit all courses simultaneously with one click.
- Acceptance Criteria:
 - *The system must allow users to add a course section to a “Registration Planner” that will remain available until the student is ready to register for courses.
- Value Justification:

This functionality is a great convenience and lowers stress for students when preparing for course registration, it improves the efficiency of the registration workflow. But, it doesn’t solve operational needs, as students still can search the course and sign up individually on the day of registration.

Business Impact

Item 3:

User Story 3 (**High Priority**): As a Registrar, I want to generate daily enrollment reports so that I can efficiently monitor course enrollment, identify underfilled or overfilled sections, and make informed scheduling decisions.

○ Acceptance Criteria:

- * The system shall generate an enrollment report showing each course section's current enrollment and remaining available seats.

- * The report shall include course information, instructor name, maximum capacity, and current enrollment.

- * Authorized registrar staff shall be able to view or download the report.

○ Business Impact Justification:

This functionality has a significant business impact because it improves operational efficiency by reducing the time required to manually compile enrollment data. Accurate enrollment reporting enables the university to make better decisions regarding course offerings, classroom assignments, and instructor workloads. It also supports more efficient resource planning and reduces administrative costs, making it a High-priority feature.

Item 4:

User Story 4 (**Medium Priority**): As a Student, I want to receive a confirmation email after successfully registering for a course so that I know my registration was completed successfully

- Acceptance Criteria:

- * A confirmation email shall automatically be sent after a successful course registration.

- * The email shall include the student's name, registered course, section information, and registration date.

- * No confirmation email shall be sent if the registration process fails.

- Business Impact Justification:

This feature improves administrative efficiency by reducing student uncertainty and minimizing support requests related to registration status. Although it enhances the overall user experience and reduces the workload on university staff, it does not directly affect the core registration process or university operations. Therefore, it is assigned a Medium priority.

Item 5:

User Story 5 (**Medium Priority**): As an Administrator, I want to manage course offerings each semester in order to ensure students have access to accurate and up-to-date course information.

- Acceptance Criteria:

- * The system shall allow administrators to create, edit, and remove course offerings.
- * Changes shall immediately update the course catalog available to students.
- * Only authorized administrators shall be permitted to modify course offerings.

- Business Impact Justification:

This functionality is assigned a Medium priority because it improves operational efficiency by allowing administrators to maintain accurate course information without relying on manual processes. Keeping the course catalog current reduces scheduling errors and improves the overall registration experience. Although important, the system can still operate with an existing course catalog, making this a Medium-priority feature.

Dependency Considerations

Item 6:

User Story 6 (**High Priority**): As a Student, I want to register for available course sections in order to build my class schedule for the semester.

○ Acceptance Criteria:

- * The system shall allow a student to select and register for an available course section.

- * The system shall verify prerequisites, enrollment capacity, and duplicate registrations before completing enrollment.

- * Upon successful registration, the student's schedule shall immediately display the newly added course.

○ Dependency Justification:

This functionality is assigned a High priority because it serves as a foundational feature for the Course Registration System. Several other user stories—including viewing student schedules, generating enrollment reports, displaying instructor class rosters, and sending registration confirmation emails—depend on successful course registration. Implementing this feature first enables the development and testing of multiple dependent features, making it essential to the overall product backlog.

Item 7:

User Story 7 (**Medium Priority**): As an Instructor, I want to view the list of students enrolled in my assigned course sections in order to prepare course materials and communicate with enrolled students.

○ Acceptance Criteria:

- * The system shall display only students enrolled in the instructor's assigned course sections.
- * The enrollment list shall automatically update whenever a student adds or drops a course.
- * Only authorized instructors shall have access to their assigned enrollment lists.

○ Dependency Justification:

This functionality is assigned a Medium priority because it depends on the successful implementation of student course registration. Student enrollment information must exist before instructors can view accurate class rosters. While this feature is important for instructional preparation, it cannot be implemented until the foundational registration functionality is complete.

Time Sensitivity

Item 8:

User Story 8 (**Low Priority**): As a Student, I want to view detailed course descriptions and instructor information in order to make informed course selection decisions before registration.

○ Acceptance Criteria:

- * The system shall display the course description, instructor name, credit hours, prerequisites, and course modality.
- * The information shall be accessible from the course search results.
- * The displayed information shall accurately match the selected course section.

○ Time Sensitivity Justification:

This functionality is assigned a Low priority because it is not required for the initial operation or demonstration of the Course Registration System. Although it improves the student experience, the system can successfully support course registration without detailed course information during the first release. This feature can be implemented after higher-priority registration functionality has been completed.

Item 9:

User Story 9 (**Low Priority**): As a Student, I want to update my personal profile information in order to keep my account information current.

○ Acceptance Criteria:

- * The system shall allow students to update personal information such as phone number and email address.
- * Updated information shall be saved immediately after submission.
- * Only authenticated users shall be permitted to modify their own profile information.

○ Time Sensitivity Justification:

This functionality is assigned a Low priority because it is not driven by immediate deadlines or external requirements. The initial release of the Course Registration System can function successfully without profile editing capabilities, allowing the development team to focus first on essential registration and enrollment features.

This enhancement can be scheduled for a later sprint without affecting the system's core functionality.

Item 10:

User Story 10 (**Low Priority**): As a Student, I want to receive notifications when seats become available in a full course in order to register as soon as an opening occurs.

○ Acceptance Criteria:

- * The system shall allow students to request notifications for full course sections.
- * The system shall automatically send a notification when a seat becomes available.
- * Notifications shall only be sent to students who requested them.

○ Time Sensitivity Justification:

This functionality is assigned a Low priority because it is not required for the initial deployment or demonstration of the Course Registration System. While it improves convenience for students, the registration process can function successfully without automatic seat availability notifications. This feature can be implemented during a later development sprint after essential registration functionality has been completed.

Statement from Team 7

We had 100% involvement from every team member.

Assignment requirements:

- The team identifies the key stakeholders and users of the product.
- The team creates user stories that capture the functional requirements of the product.
- The user stories follow the form described in class: As a ____, I want to ____ in order to ____

- The user stories follow the INVEST criteria (Independent, Negotiable, Valuable, Estimable, Small, and Testable).
- Each user story includes a clear description, and a priority.
- Each user story has a statement justifying the priority ranking.
- The submission only contains user stories: There are no themes, epics, or tasks.
- Each user story must include at least one acceptance criterion that clearly defines when the user story has been successfully completed.
- The team submitted at least 10 user stories.
